Coronavirus 2019-nCoV

Coronavirus 2019-nCoV is an enveloped virus from the Coronaviridae family. Due to its lipid layer it is easy to inactivate by lipid solvents that have been proven to work against enveloped viruses.

All MEDISEPT disinfection products (both alcohol and non-alcohol, based on chlorides and amines) are effective against coronavirus, as they have been tested according to ex. EN 14476 or DVV / RKI, for enveloped viruses.

Coronavirus 2019-nCoV

The first strains of human coronavirus were identified in the 1960s, so the virus itself is not new. Respiratory tract epidemics break out almost every 3 years, most often in late autumn, winter and early spring. Currently seven species of coronavirus causing human infection are identified. New, **eighth human coronavirus** has been identified in Wuhan in December (2019-nCoV).

At this point it should be emphasized that there is still a season of increased influenza incidence. From **1st till 22nd January 2020, 127 696 cases** of influenza and suspected influenza were registered in Poland, with 2 deaths*.

The scale of this phenomenon causes also losses for employers.

Coronavirus 2019-nCoV

In both infection cases: caused by **Coronavirus and influenza virus**, it is very important to prevent the transfer of microorganisms between people.

According to Polish Chief Sanitary Inspectorate and WHO recommendations, large groups of people should be avoided, frequent **hand washing** and proper **disinfection** of hands and surfaces that have contact with excreta (e.g. by sneezing, coughing or touching) should be remembered.

A responsible attitude and compliance with hygiene rules will help to protect against these serious infections.

Coronavirus 2019-nCoV

Viruses can be located in the respiratory tract or even in urine and faeces.

Direct contact with these secretions may cause transmission of infection from person to person.

OBJAWY

Typowe objawy zakażenia wirusem z Wuhan (2019-nCoV) obejmują gorączkę, kaszel i duszności (objawy podobne do grypy).
